INVESTOR ACCOUNTS

Account Holding

The operating system for a certificate relationship. One application, one advisor, and one record from the first letter to an active CD.

Investor portal

Operations desk

Advisor letters

THE GAP

High-balance CDs still run on inboxes.

A serious certificate is a sequence of conversations, documents, and money. Most of that sequence is still scattered.

01	The rate and the application live in different places.
02	The advisor cannot see whether the client signed, is waiting, or has wired.
03	Funding instructions sit in a file the client has to hunt for.
04	Once the CD is open, the client still has no single view of term, rate, and maturity.

THE PRODUCT

A portal for the client. A desk for the firm.

01

Investor portal

Apply, sign, fund, and watch the certificate. The client sees only the next step that is actually theirs.

02

Operations desk

Review the application, assign the advisor, issue the invoice, and confirm the wire. Status is a record, not a memory.

03

Advisor letters

Send the rate chart, a 24-hour application, and a reminder from the advisor's own mailbox.

THE PATH

Six moves. No skipped gates.

1 Apply

Name, documents if they have them, amount, and term.

2 Approve

The desk opens the portal. Nothing is invested yet.

3 Accept

The client signs the terms. The investment is created here.

4 Invoice

The desk approves funding and the wire instructions appear.

5 Confirm

The client uploads the wire. The advisor approves it.

6 Active

The certificate shows term, rate, dates, and its package.

FOR THE INVESTOR

A portal that only shows the live work.

Rates	Featured terms first, then the rest. A promotional term opens its bonus tiers.
Calculator	The amount chips match the tiers. The rate matches the term they picked.
Signature	Drawn once on the application, then applied to later certificates.
Progress	Each investment has its own steps: terms, invoice, wire, active.
Certificate	An active CD keeps amount, APY, start, maturity, and the confirmation package.

ADVISOR MOTION

The letter does the first meeting.

Rate chart — An introduction with the current terms, sent from the advisor's verified mailbox.

One term — A temporary application shows only the rate that was offered, plus a promo code.

24 hours — The link expires. A reminder goes out before it does, with the same button.

Two numbers — The signature is the advisor. The help bar is the company phone.

FOR THE FIRM

The desk is grouped the way the work is.

Pipeline	Certificates	People	House
Applications, with the full file and documents	Investments, from pending call to active	Clients, including sign-in as that client	Name, phone, domain, colors, and logo
Leads, ready for a CRM later	Invoices and active CDs, with the package	Advisors, roles, mailbox, and personal number	Email templates, Resend, and SMTP2GO

CONTROL

Money does not move on a guess.

No investment before terms

The desk does not hold a certificate until the client accepts and signs.

No invoice before approval

Wire instructions appear only after the desk creates the invoice.

No active CD before payment

The advisor confirms the wire. Then the certificate moves to Active.

FDIC, stated once

Capital protection is part of the offer, not a footnote the client has to find.

WHAT IS ALREADY RUNNING

This is the working surface, not a roadmap.

- Six-step application with preferred amount and term
- Investor login, reset, and a portal link that uses your domain
- Rates, promo tiers, and a calculator that follows the selection
- Signed terms, invoice PDF, and wire confirmation
- Active CD detail, maturity bar, and confirmation package
- Leads list for the CRM that comes next
- Advisor role, mailbox, and personal number
- Resend for desk mail, SMTP2GO for advisor letters
- Colors, logos, background, and footer under the firm's control
- Daily database backup, emailed as a zip

THE ASK

Put the relationship on one record.

Account Holding is ready to run a certificate desk: the client's portal, the firm's operations, and the advisor's letter, with the gates that keep a CD from becoming active too early.
